**Human Papilloma Virus can put the future of your daughter at risk-
you can help protect her!**

Cervical Cancer – It's never too early to think about it.

Teens and young ladies are the ones at risk to this virus because it is their growth period.

In case of infection and no full recovery, the patient is at risk of cervical cancer.

Therefore, those who were diagnosed with cervical cancer at their 35-50 years old are most probably patients who were exposed to HPV at younger age.

Cervical Cancer is a result of HPV infection:

The cervix is the narrow passage forming the lower end of the uterus.

Vaginal Cancer-Hard to detect:

85-90% of vaginal cancer starts at the lining of the vagina, & mostly shows no symptoms.

Cancer of the vulva-Watch for any early signs:

Burning feeling, itchiness, dysuria, swelling are signs of vulva cancer which will spread to the inner edges of the outer folds of the vagina.

Pre-cancerous cells:

Cancer starts when infected with high risk HPV viruses where it causes the production of abnormal cells at the cervix, vagina & the vulva. In case not detected early, it can turn into cancer.

It is painful to think that your daughter can have any of the above and crush her dreams of a healthy future. You can act now to protect her and her future.
